PULPDENT INTRODUCES WINK™ LUBRICANT AND RELEASE AGENT

WATERTOWN, MA: December 15, 2009— Pulpdent Corporation has introduced WINK™, a greaseless, water soluble lubricant and release agent for all dental applications. WINK replaces petroleum jelly and other greasy, lumpy, and hard to remove materials. It goes on smoothly and evenly, is easily thinned with compressed air, and washes off quickly with water.

Wink has a wide range of uses and applications. It provides easy release of impressions and prevents the distortion caused by torque and stresses during removal from the mouth, even with polyether impression materials.

For provisional restorations, WINK can be placed on build ups, teeth and preps to provide fast and easy removal from the mouth after curing. Wink can also be placed on the outside surface of restorations for effortless removal of excess set cement.

Dental professionals can use Wink when making final impressions for removable partial dentures and can place it on the buccal surfaces of dentures during relining procedures.

WINK can also be used on rubber dams to facilitate placement without tearing, on face and tissue for easy removal of excess set cement and impression material, and on tight-fitting implant abutments for easy removal during the try-in phase.
